

Travelling Landscaper

Ben Meshanko

Software Pipeline Overview

Conversion to Coordinates

- Geocoding API
- Address -> Lat/Long
- Python requests library

```
    "formatted_address" : "West Lafayette, IN, USA",  
    "geometry" : {  
        "bounds" : {  
            "northeast" : {  
                "lat" : 40.489698,  
                "lng" : -86.8878868  
            },  
            "southwest" : {  
                "lat" : 40.4156141,  
                "lng" : -86.9457989  
            }  
        },  
        "location" : {  
            "lat" : 40.4258686,  
            "lng" : -86.90806549999999  
        },  
    },
```

K Means Clustering

- Convert Lat/Long to nparray
- Ran Clustering Algorithm (G4G)
- Python matplotlib library
- Used center to determine two clusters, 40 -> 18/22

Note: The Earth is not flat, but the points are close enough to not skew

Distance Matrix from Clusters

- Distance Matrix API
- Parse “duration” to int representing minutes
- Added in origin, clusters are now 19/23

```
"destination_addresses" : [ "Bloomington, IN, USA" ],
"origin_addresses" : [ "West Lafayette, IN, USA" ],
"rows" : [
  {
    "elements" : [
      {
        "distance" : {
          "text" : "114 mi",
          "value" : 183735
        },
        "duration" : {
          "text" : "2 hours 5 mins",
          "value" : 7471
        },
        "status" : "OK"
      }
    ]
  }
],
"status" : "OK"
```

Computing Shortest Path with TSP

- Tried $O(n!)$ implementation in Python, quickly gave up
 - $23! = 2.58e22$
 - C++ is far faster anyways
- Runtime: $O(n^2 2^n)$.
- Outputs abstract 0-indexed graph path

Can you give me code that solves TSP using dynamic programming?

c++ please

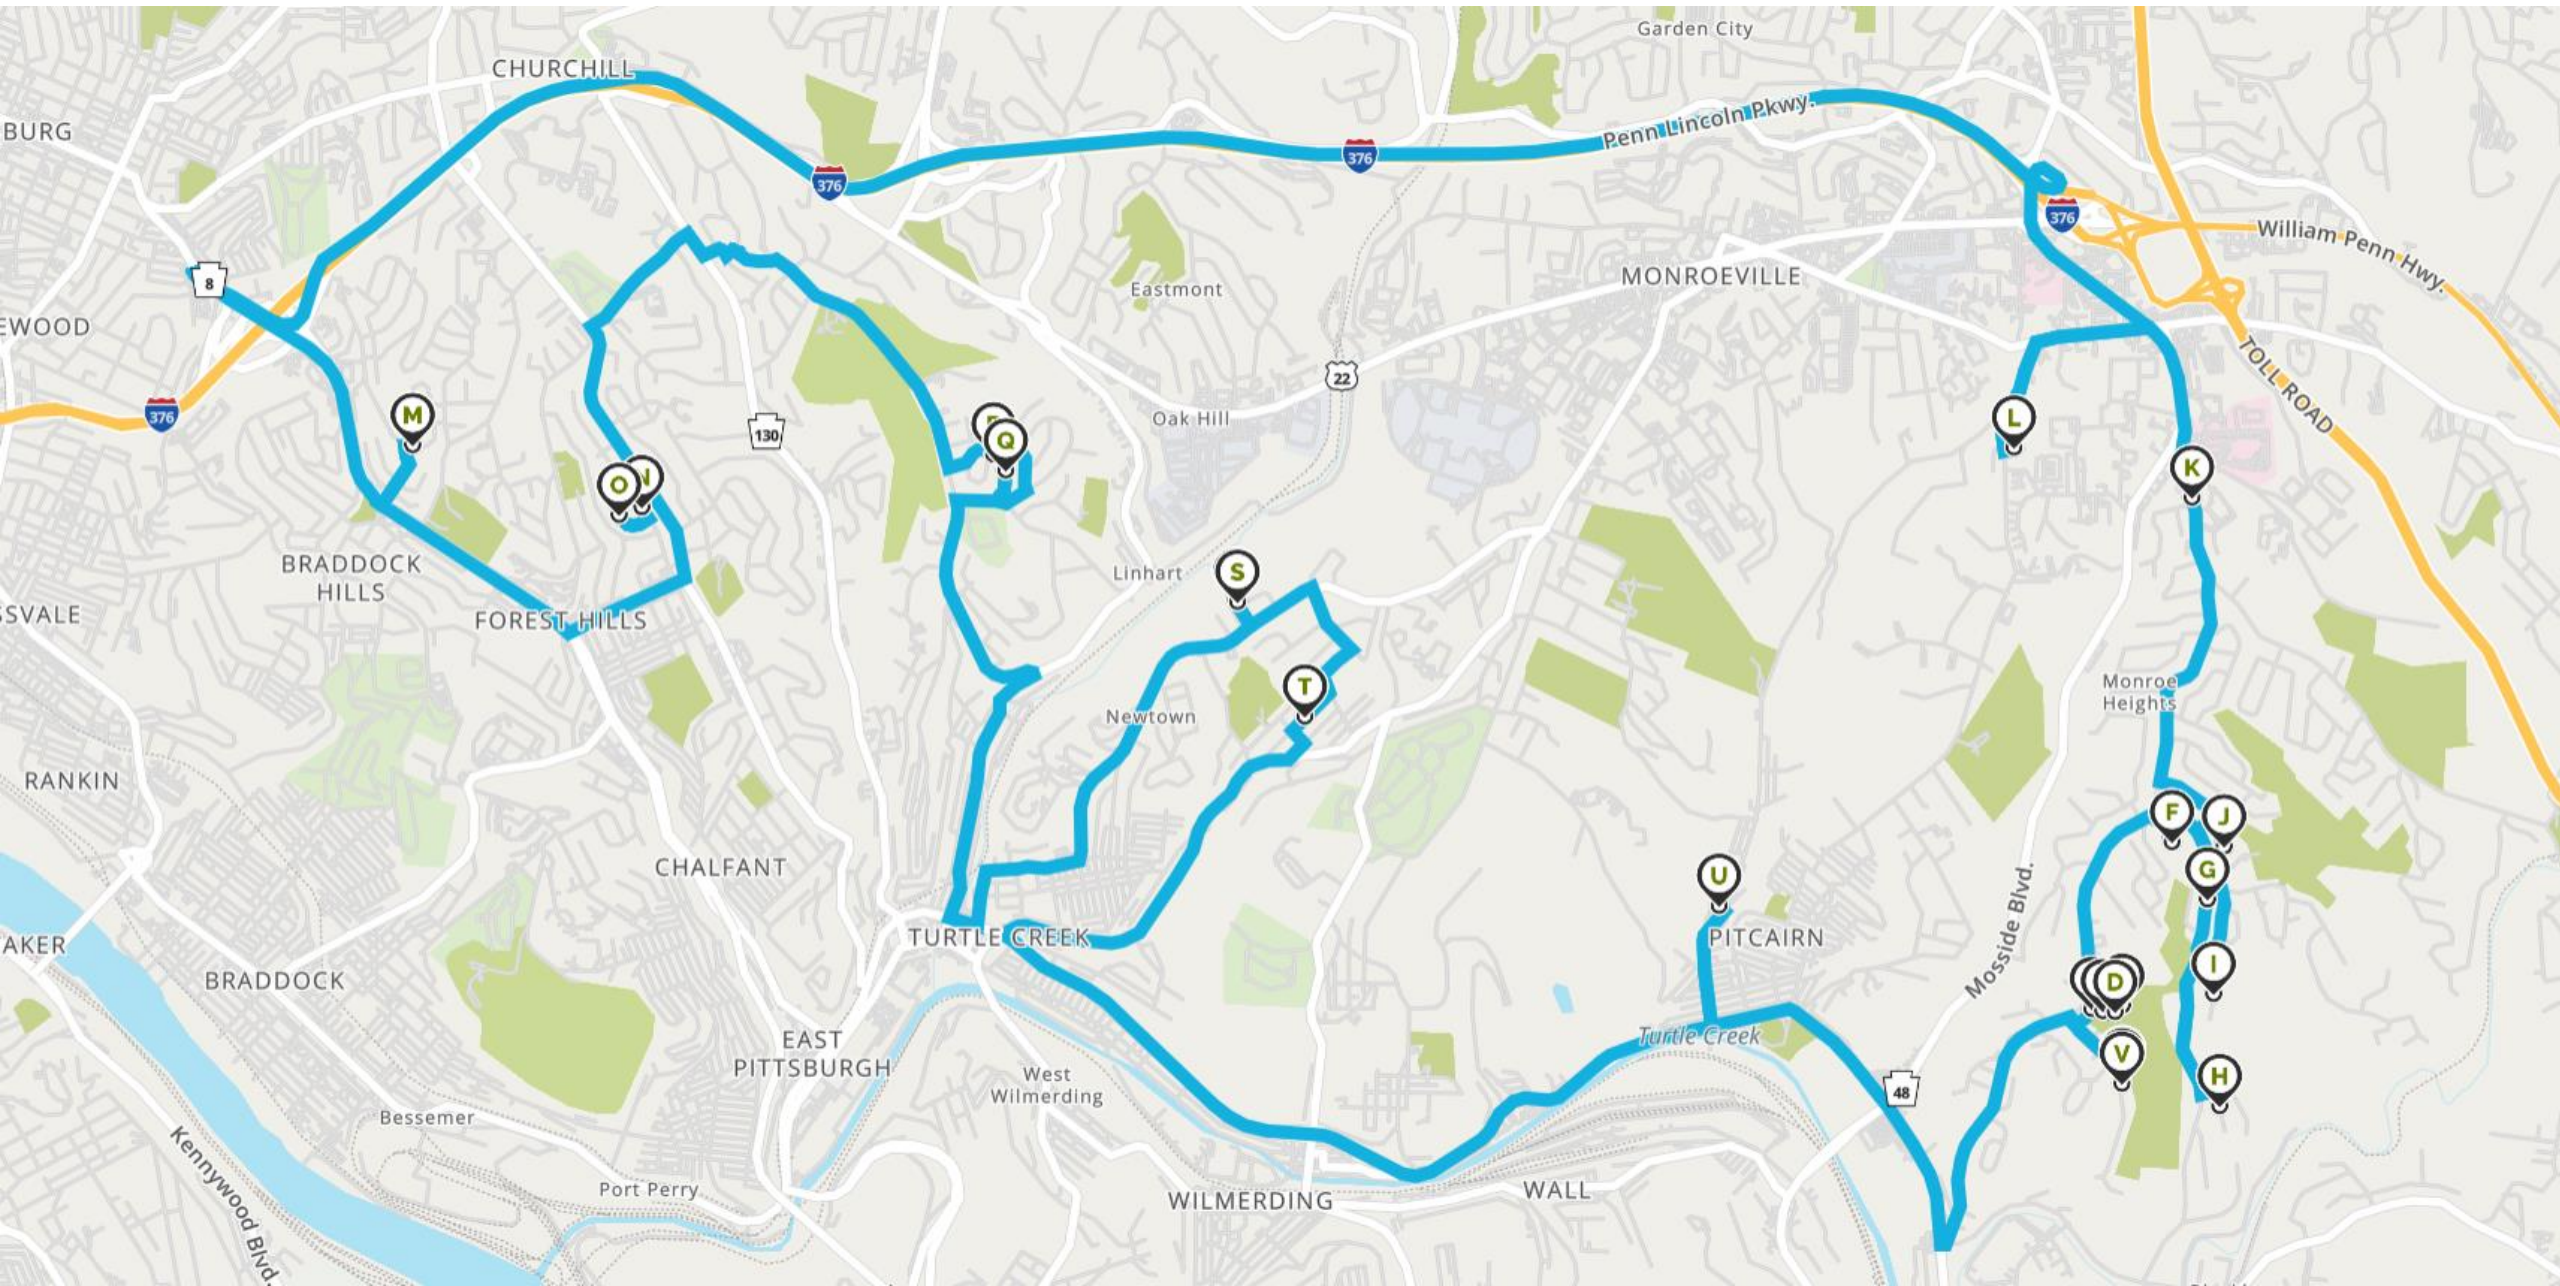

Awesome. In CS, we call a "gratitude" something that saves the previous sub-problem and allows you to access the entire path for a dynamic programming problem such as this one. Can you modify this code to add "gratitude" that will output both the cost AND the path?

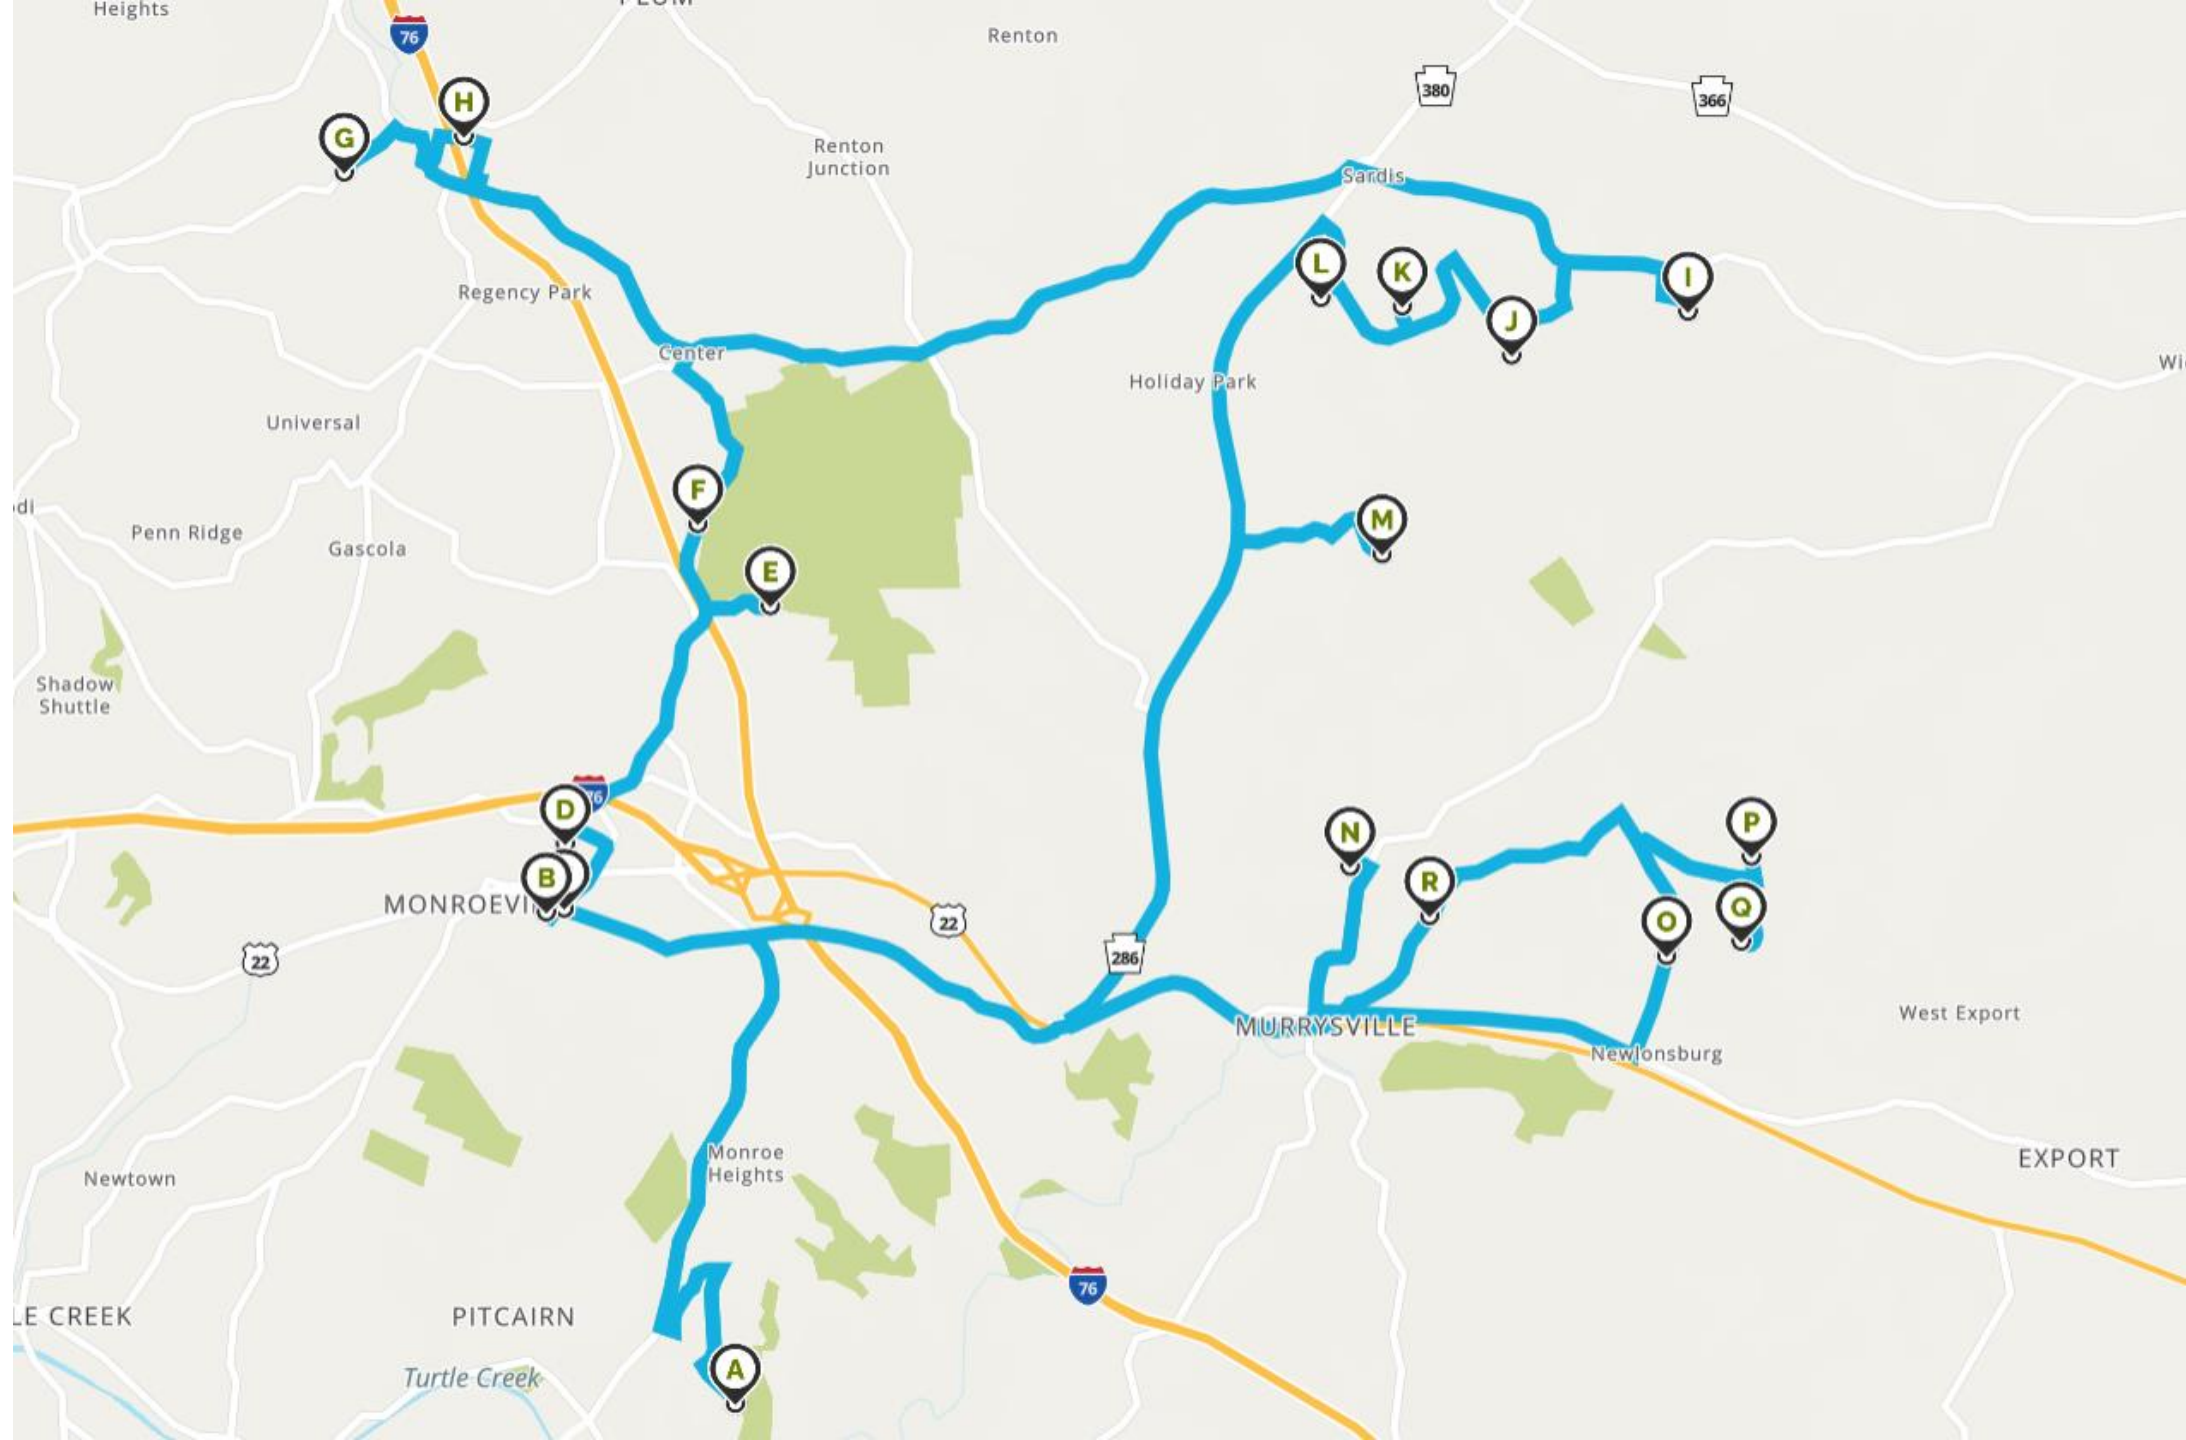

Nothing has changed, and I still get an output of 0. Should we also need to memset parent?

Thank you ChatGPT. It works. I was copying your code wrong and not memsetting to -1 before running tsp

What I Learned/Struggled With

- GCP Maps API is pretty incredible, but
- Python is sub-optimal for intensive computation
- Larger Sample Size -> Move to Cloud
 - GPU Optimizations
- One last thing...

Remember this question from HW3?

20. You have been hired by a company that is moving an application that processes over a hundred Terabytes of data to the cloud. None of the software engineers has any experience with Hadoop, and they all need to learn how to use it. Your manager is incredibly worried about the ``training cost'' (i.e., the cloud charges that will be incurred while the software engineers learn about Hadoop and debug various pieces of software. What do you recommend to your manager as a way to avoid the training expenses?

I also depleted the \$50 educational credit...
